

Portfolio Manager - Quick Beginner Guide

A short onboarding guide for the main sidebar tools and the Portfolio Builder wizard workflow.

Sidebar Overview

Portfolio Manager is organized around the main tools available in the sidebar:

Settings	Application preferences, license, updates, paths, and general configuration.
Subworkers	Manage the MT5 worker terminals used for parallel backtesting.
Backtester	Queue and run MT5 backtests for selected strategies.
Portfolio Tools	Manual tools for balancing, lot sizing, and calibration.
Strategy Scaler	Rescale an already calibrated portfolio to a new drawdown target.
Portfolio Builder	The wizard that automates the full portfolio building workflow.

Portfolio Builder

Portfolio Builder is the easiest way to combine multiple UBS .set strategies into one balanced portfolio.

Wim's videos show how to backtest and balance different strategies so they can run together in a single account with controlled risk. The Portfolio Builder wizard automates the complete process.

The wizard can:

- Backtest all selected strategies.
- Measure each strategy and identify the one with the highest max drawdown.
- Balance all strategies to an equal drawdown value.
- Calibrate the full portfolio to your desired max drawdown percentage.
- Show portfolio statistics such as DD, Ret/DD, profit, and related metrics.
- Generate the final calibrated .set files automatically.

Portfolio Builder Workflow

Step 1 - Setup

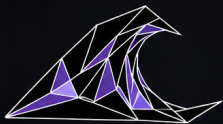

Load the UBS .set files you want to combine. Usually, these should be strategies for the same symbol. Choose the date range, initial balance, leverage, and tick model. Click Next, enter the workspace name, and choose the folder where the workspace should be stored.

Step 2 - Backtest All

Run the backtest process for every selected strategy before balancing. This step measures the raw performance of each strategy, including profit and max drawdown, so Portfolio Builder can identify the strategy with the highest drawdown and prepare the data required for balancing.

Step 3 - Balance

Choose the target max drawdown amount. This value is usually equal to or greater than the highest max drawdown amount found during Backtest All. The wizard balances all strategies toward the selected drawdown amount, so they contribute risk in a controlled and comparable way.

Step 4 - Calibration

Enter your desired portfolio risk ceiling as a percentage, for example 10%, 20%, or 40%. Portfolio Builder automatically recalculates the risk input parameters for all strategies so the portfolio targets your selected drawdown percentage.

Step 5 - Statistics

Review the portfolio-level statistics before using the generated files. The Statistics view shows important portfolio information such as drawdown, Ret/DD, profit, and other performance metrics that help you validate the final portfolio.

Final output: when the process finishes, the workspace folder selected during setup will contain the generated files. The calibrated .set files will be inside the Calibration folder. Load those files into your MT5 terminal to run the strategies with the calibrated risk settings.

Portfolio Tools

Use Portfolio Tools if you prefer to do the balancing and calibration process manually.

Instead of using the automatic Portfolio Builder wizard, Portfolio Tools allows you to manually compute lot size steps and generate the .set files yourself. This is useful when you want more control over each step of the process.

Strategy Scaler

Use Strategy Scaler when you already have a completed portfolio and want to adjust its risk level without rebuilding everything from scratch.

Example: if your current portfolio was calibrated to 40% max drawdown and you want to reduce it to 20%, Strategy Scaler can recompute the lot size steps for the new target.

Reducing the target from 40% to 20% means each 0.01 lot requires approximately double the balance. This reduces the effective trading risk by half.

Recommended Beginner Path

- Start with Portfolio Builder if you want the automatic wizard workflow.
- Use Portfolio Tools only when you want to control balancing and calibration manually.
- Use Strategy Scaler when the portfolio is already built and you only need to change the drawdown target.
- Always review the Statistics view and check the generated Calibration folder before loading the final .set files into MT5.

Note: Portfolio Manager is an analytical and research tool. Backtest results do not guarantee live trading results.
